

# Finite Combinatorial Pre-geometries

# ~~Finite Combinatorial~~ ~~Pre-geometries~~

matroids

# What is a Matroid?

# Any one of these 6 easy definitions

- ▶ A pair  $(E, I)$  of a set  $E$  and a family,  $I$ , of subsets of  $E$  such that:
  - ▶ 1)  $I$  is nonempty, 2)  $(B \in I \text{ and } A \text{ a subset of } B) \Rightarrow (A \in I)$ , and 3) for all  $A, B \in I$  with  $|A| < |B|$ , there exists a  $b \in B$  such that  $(A \cup \{b\}) \in I$ .
- ▶ A pair  $(E, B)$  of a set  $E$  and a family,  $B$ , of subsets of  $E$  such that:
  - ▶ 1)  $B$  is nonempty, 2) for all  $X, Y \in B$ , and for all  $x \in X \setminus Y$ , there exists a  $y \in Y \setminus X$  such that  $(X \setminus \{x\}) \cup \{y\}$  is in  $B$ .
- ▶ A pair  $(E, r)$  of a set  $E$  and a function  $r: 2^E \rightarrow \mathbb{N}$  such that  $r$  satisfies:
  - ▶ 1) For all subsets  $A$  of  $E$ ,  $0 \leq r(A) \leq |A|$ , 2) For all subsets  $A$  and  $B$  of  $E$ ,  $r(A) + r(B) \geq r(A \cup B) + r(A \cap B)$ , and 3) for all  $A$  subset of  $E$ ,  $x \in E$ ,  $x$  not in  $A$ ,  $r(A) \leq r(A \cup \{x\}) \leq r(A) + 1$
- ▶ A pair  $(E, cl)$  of a set  $E$  and a function  $cl: 2^E \rightarrow 2^E$  such that  $cl$  satisfies
  - ▶ 1) For all  $A \in P(E)$ ,  $A \subseteq cl(A)$ , 2)  $cl(A) = cl(cl(A))$ , 3) for all  $A, B \in P(E)$ ,  $A \subseteq B$  implies  $cl(A) \subseteq cl(B)$ , and 4) for all  $a$  and  $b \in E$ , and all subsets  $Y$  of  $E$ ,  $a \in cl(Y \cup \{b\}) \setminus cl(Y)$  iff  $b \in cl(Y \cup \{a\}) \setminus cl(Y)$
- ▶ A pair  $(E, F)$  of a set  $E$  and a family,  $F$ , of subsets of  $E$  such that:
  - ▶ 1)  $E \in F$ , 2)  $A$  and  $B \in F$  implies  $(A \cap B) \in F$ , and 3) if  $S \in F$ , then the sets in  $F$  that cover  $S$  under the containment relationship form a partition of  $E \setminus S$ .
- ▶ A finite atomic semimodular lattice

Got That? Let's Proceed...

No JK. All of that is true, but what *IS* a matroid?

What even is math?

# Big theme: idea becomes encapsulated by an object

- ▶ Linearity encapsulated by vector spaces
- ▶ Continuity encapsulated by topological spaces
- ▶ Symmetry encapsulated by groups
- ▶ Smoothness encapsulated by manifolds
- ▶ “Volume” encapsulated by measurable spaces (and sigma algebras)
- ▶ Connectivity encapsulated by graphs
- ▶ Relatedness encapsulated by posets and lattices
- ▶ Composition encapsulated by a category
- ▶ Things that might happen encapsulated by a probability space

# Big theme: idea becomes encapsulated by an object

- ▶ Linearity encapsulated by vector spaces \*
- ▶ Continuity encapsulated by topological spaces
- ▶ Symmetry encapsulated by groups \*
- ▶ Smoothness encapsulated by manifolds
- ▶ “Volume” encapsulated by measurable spaces (and sigma algebras)
- ▶ Connectivity encapsulated by graphs \*
- ▶ Relatedness encapsulated by posets and lattices \*
- ▶ Composition encapsulated by a category \*
- ▶ Things that might happen encapsulated by a probability space

# Big theme: idea becomes encapsulated by an object

- ▶ Linearity encapsulated by vector spaces
- ▶ Continuity encapsulated by topological spaces \*

- ▶ Smoothness encapsulated by manifolds \*
- ▶ “Volume” encapsulated by measurable spaces (and sigma algebras) \*
- ▶ Connectivity encapsulated by graphs
- ▶ Relatedness encapsulated by posets and lattices
- ▶ Composition encapsulated by a category
- ▶ Things that might happen encapsulated by a probability space \*

# Secondary theme: “object” means set with structure

- ▶ Algebraic structure: operations, relations, what have you
- ▶ Structure could be like a function on the set (e.g. metric on a metric space, atlas of charts on a manifold)
- ▶ Sometimes, structure means certain distinguished subsets of some set based on the original, or the original itself (e.g. topological spaces, sigma algebras, relations, graphs)
- ▶ Then the axioms!

Matroids fit all these patterns

# They also reveal deep similarities between

- ▶ Linear Algebra
- ▶ Graph Theory
- ▶ Finite Geometry

# Pictures of Matroids

<- not quite actually

How exactly matroids do this

Idea: linear independence, or redundancy

Execution: set along with a collection of subsets

# Some History

- ▶ Whitney
- ▶ Rota
  - ▶ “It is as if one were to condense all trends of present-day mathematics onto a single finite structure, a feat that anyone would a priori deem impossible, were it not for the mere fact that matroids do exist.”
  - ▶ He really lobbied hard to call them Combinatorial Geometries
- ▶ Robbins

# Example for the non math person

- ▶ Pages in a book
  - ▶ You have to read some history book chapter for a class
  - ▶ You've got a strong feeling that any 5 pages will suffice
  - ▶ Boom, Matroid

# Examples for the math person

- ▶ Vectors in a vector space
- ▶ Edges in a graph

# Definitions Revisited - Independent Sets

- ▶ A pair  $(E, \mathcal{I})$  of a set  $E$  and a family,  $\mathcal{I}$ , of subsets of  $E$  such that:
  - ▶ 1)  $\mathcal{I}$  is nonempty
  - ▶ 2)  $(B \in \mathcal{I} \text{ and } A \text{ a subset of } B) \Rightarrow (A \in \mathcal{I})$ ,
  - ▶ 3) for all  $A, B \in \mathcal{I}$  with  $|A| < |B|$ , there exists a  $b \in B$  such that  $(A \cup \{b\}) \in \mathcal{I}$ .

# Definitions Revisited - Basis Sets

- ▶ A pair  $(E, \mathcal{B})$  of a set  $E$  and a family,  $\mathcal{B}$ , of subsets of  $E$  such that:
  - ▶ 1)  $\mathcal{B}$  is nonempty
  - ▶ 2) for all  $X, Y$  in  $\mathcal{B}$ , and for all  $x$  in  $X \setminus Y$ , there exists a  $y$  in  $Y \setminus X$  such that  $(X \setminus \{x\}) \cup \{y\}$  is in  $\mathcal{B}$ .

# Definitions Revisited - Rank Function

- ▶ A pair  $(E, r)$  of a set  $E$  and a function  $r: 2^E \rightarrow \mathbb{N}$  such that  $r$  satisfies:
  - ▶ 1) For all subsets  $A$  of  $E$ ,  $0 \leq r(A) \leq |A|$
  - ▶ 2) For all subsets  $A$  and  $B$  of  $E$ ,  $r(A) + r(B) \geq r(A \cup B) + r(A \cap B)$
  - ▶ 3) for all  $A$  subset of  $E$ ,  $x \in E$ ,  $x \notin A$ ,  $r(A) \leq r(A \cup \{x\}) \leq r(A) + 1$

# Definitions Revisited - Closure Operator

- ▶ A pair  $(E, cl)$  of a set  $E$  and a function  $cl:2^E \rightarrow 2^E$  such that  $cl$  satisfies:
  - ▶ 1) For all  $A$  in  $P(E)$ ,  $A$  contained in  $cl(A)$
  - ▶ 2)  $cl(A) = cl(cl(A))$
  - ▶ 3) for all  $A, B$  in  $P(E)$ ,  $A$  in  $B$  implies  $cl(A)$  in  $cl(B)$
  - ▶ 4) for all  $a$  and  $b$  in  $E$ , and all subsets  $Y$  of  $E$ ,  $a$  in  $cl(Y \cup \{b\}) \setminus cl(Y)$  iff  $b$  in  $cl(Y \cup \{a\}) \setminus cl(Y)$

# Definitions Revisited - Flats (closed sets)

- ▶ A pair  $(E, \mathcal{F})$  of a set  $E$  and a family,  $\mathcal{F}$ , of subsets of  $E$  such that:
  - ▶ 1)  $E \in \mathcal{F}$
  - ▶ 2)  $A$  and  $B$  in  $\mathcal{F}$  implies  $(A \cap B) \in \mathcal{F}$
  - ▶ 3) if  $S \in \mathcal{F}$ , then the sets in  $\mathcal{F}$  that cover  $S$  under the containment relationship form a partition of  $E \setminus S$ .

# Why do we care

- ▶ Cliché answer - matroids are nice

# Greedy algorithm

- ▶ How nice? Greedy algorithm!
  - ▶ if your elements have weights, you can always build a minimum weight basis set by adding the cheapest element that isn't dependent with anything else you've added so far.

# Example of Greedy Alg on a (simple) Graphic Matroid - Kruskal's Algorithm
